Silver Nanowires are included in DropSens Nanomaterials range and are produced via the electrochemical deposition on an alumina template. After dissolving the alumina, purified metal nanowires are obtained.

The manufacturing process allows customising the dimensions of these nanowires. Our standard process produces Silver Nanowires with an average diameter of 150-250 nm and an average length varying in two ranges: 6-9 µm or 12-18 µm.

Nanowires are commercialised in ethanol solution with a concentration of 8.9·10^8 NW/mL.

Nanowires in other metallic materials such as Nickel, Gold, Platinum and Palladium or Pt-Au-Ni Nanowires are also available under request.

This product is available in 1.5 or 4.5 mL order quantities.
