

# Potentiometric sensor for ammonium detection

01

## Ref. 110NHION

These disposable Screen-Printed Electrodes are based on an ammonium ionophore for the selective detection of this ion. Sensors were designed to measure ammonium by open circuit potentiometry (OCP) in a range of concentration  $10^{-5}$  to 1 M (from 0.2 to 17000 ppm).

These ammonium ion sensors are recommended for working with microvolumes and are ideal for decentralized and 'in situ' assays.

Ceramic substrate: L34 x W10 x H0.5 mm

Electric contacts: Silver

The electrochemical cell consists of:

Working electrode: Carbon/Ammonium ionophore (4 mm diameter)

Auxiliary electrode: Carbon

Reference electrode: Silver

These potentiometric sensors for ammonium detection are commercialised in 50 units pack. They should be stored at room temperature, protected from light in a dry place.
